

In a realistic feed, the two-step system checks memes twice as fast

Seconds per meme · one graphics card (NVIDIA V100 32 GB)

AI judge alone (Qwen3.5-9B): measured. Two-step system: pre-filter time (measured, 0.03 s per meme) plus the judge's time on the memes passed on, computed from measured times, not a separate run. The rarer harmful content is in the feed, the larger the gain.
