

All four AI models recognise sexual content in memes equally well

Four open-source AI models · 120 hand-checked memes

We showed 120 memes, checked by hand (60 with sexual content, 60 without), to each AI model, which saw the image and the text written on it. Bars show the accuracy score (F1): the balance between catching harmful memes and avoiding false alarms (1.0 = perfect). Black lines show the uncertainty range; the ranges overlap, so the differences are not statistically significant.
